Introduction to Statistics and Statistical Measures

What is Statistics?

- Statistics is the collection, organizing and analysing of data.

Is Data Science Statistics in Disguise?

- Unlike Statistics, Data Science is an interdisciplinary field consisting of Mathematics, Statistics, Computer Science and Domain Knowledge.

Types of Data

- Data can be classified into two types
 - Based on Measurement scale
 - Based on Time Period

Based on Measurement Scale

- Qualitative Data
 - Nominal Data e.g sex
 - Ordinal Data e.g temperature level; High, Medium and Low
- Quantitative Data
 - Ratio e.g weight
 - Interval e.g temperature in degree celsius

Based on Time Period

- Cross-Sectional Data e.g number of viewers for different youtube genres in the year 2021
- Time Series Data e.g number of viewers for Sport channels on youtube from the year 2014-Date.

Types of Data

Figure 1: Types of Data

Rectangular or Structured Data

	carat	cut	color	clarity	depth	table	price	x	y	z
1	0.23	Ideal	E	SI2	61.5	55.0	326	3.95	3.98	2.43

17	0.30	Ideal	I	SI2	62.0	54.0	348	4.31	4.34	2.68
18	0.30	Good	J	SI1	63.4	54.0	351	4.23	4.29	2.70

Measures of Central Tendency

Mean

- Sum of all values of observations divided by the number of observations
- Mathematically denoted as:
$$\bar{a} = \frac{\sum_i^n x_i}{n}$$
- Sensitive to extreme or high values

Median

- Center of an ordered observations
- Also known as the middle of the observations.
- Not sensitive to extreme values

Mode

- Observation with the highest number of occurrence.

Measures of Variation

Standard Deviation and Variance

- Measures how far an observation is from the mean
- Mathematically defined as:

$$s = \sqrt{\frac{\sum_i^n (x_i - \bar{x})^2}{n}}$$

- Variance is defined as the square of the standard deviation:
 $Variance = s^2$

Range

- Difference between the largest and smallest observations.
- Sensitive to extreme values

Percentiles

- Expressing the sorted observations in percentage
- Not sensitive to extreme values

Interquartile Range

- The interquartile range divides the observations into 4 equal part:
 - First Quartile: Q1
 - Second Quartile: Q2 (median)
 - Third Quartile: Q3

Summary Statistics of the Diamond Data Set

Probability and Probability Distributions

What is probability

- It is simply the study of uncertainty.
- Example the possibility of raining, tossing a coin or rolling a die.
- It is the measuring of how likely an event will occur.
- Mathematically defined as:

$$Probability = \frac{\text{Number of Required outcomes}}{\text{Number of Possible outcomes}}$$

Terms in Probability

- Experiment: An uncertain situation e.g tossing a coin
- Outcome: Result of a trial in an experiment.
- Event: One or more outcome from a experiment
- Sample Space: The collection of possible outcomes of an experiment.

Random Variable

- Outcome of an event expressed in numbers
- For example in the coin toss experiment we can either have a head or tail which can be numerically expressed as 1 or 0 respectively.
- Let's call a set containing these two numbers X where; $X = \{1, 0\}$.
- X represents the Random Variable
- What's the random variable of a sixed face die?

The Two Coin Toss Experiment

- $S = \{HH, HT, TH, TT\}$

$$Probability = \frac{\text{Number of Required outcomes}}{\text{Number of Possible outcomes}}$$

- Number of possible outcomes = 4

- Probability of getting a head in both coins is:

$$= \frac{\text{Number of Required outcomes}(HH)}{\text{Number of Possible outcomes}(HH, HT, TH, TT)} = \frac{1}{4}$$

- Probability of getting a head in the first coin and a tail in the second coin:

$$= \frac{\text{Number of Required outcomes}(HT)}{\text{Number of Possible outcomes}(HH, HT, TH, TT)} = \frac{1}{4}$$

- Probability of getting a head and a tail in both coins.

$$= \frac{\text{Number of Required outcomes}(HT, TH)}{\text{Number of Possible outcomes}(HH, HT, TH, TT)} = \frac{2}{4}$$

The Two Die Experiment

		White Die					
		1	2	3	4	5	6
Red Die	1	(1,1)	(2,1)	(3,1)	(4,1)	(5,1)	(6,1)
	2	(1,2)	(2,2)	(3,2)	(4,2)	(5,2)	(6,2)
	3	(1,3)	(2,3)	(3,3)	(4,3)	(5,3)	(6,3)
	4	(1,4)	(2,4)	(3,4)	(4,4)	(5,4)	(6,4)
	5	(1,5)	(2,5)	(3,5)	(4,5)	(5,5)	(6,5)
	6	(1,6)	(2,6)	(3,6)	(4,6)	(5,6)	(6,6)

Figure 9: Tabular representation of the sample space of rolling two die

The Two Die Experiment

- $S = \{(1,1), (1,2), (1,3), \dots, (6,6)\}$

$$\text{Probability} = \frac{\text{Number of Required outcomes}}{\text{Number of Possible outcomes}}$$

- Number of possible outcomes = 36

- Probability of getting a one in both die:

$$= \frac{\text{Number of Required outcomes}(1,1)}{\text{Number of Possible outcomes}} = \frac{1}{36}$$

- Probability of getting a one in the first die and a two in the second

$$\text{die:} = \frac{\text{Number of Required outcomes}(1,2)}{\text{Number of Possible outcomes}} = \frac{1}{36}$$

- Probability of getting a one and a two:

$$= \frac{\text{Number of Required outcomes}(1,2) \text{ or } (2,1)}{\text{Number of Possible outcomes}} = \frac{2}{36}$$

The Two Die Experiment

Bernoulli Distribution

- A single trial with only two possible outcomes is called as binomial distribution.
- Example is a coin tossed once or a fight between me and Mayowa(DevNet) where the probability of I winning is 0.9 and him losing is 0.1.

Distribution of a Bernoulli Experiment

Figure 11: Distribution of a Bernoulli experiment

Binomial Distribution

- Unlike the Bernoulli Distribution, the binomial distribution has n number of trials.
- A distribution is said to be Binomial if the following are satisfied;
 - A trial with two outcomes and repeated n number of trials
 - Each trial is independent
 - A total numbers of n trials are conducted
 - The probability of success and failure is same for all trials.

Distribution of a Binomial Experiment

Figure 12: Distribution of a Binomial experiment

Normal Distribution

- A distribution is said to be normally distributed if it satisfies the following conditions;
 - The mean, median and mode of the distribution are the same.
 - The curve of the distribution is bell shaped
 - Half of the value are left of the center and the other half at the right.

Central Limit Theorem

- Regardless of the distribution of a variable's population, if we have a sufficiently large sample size, the mean and standard deviation of that variable will be normally distributed.
